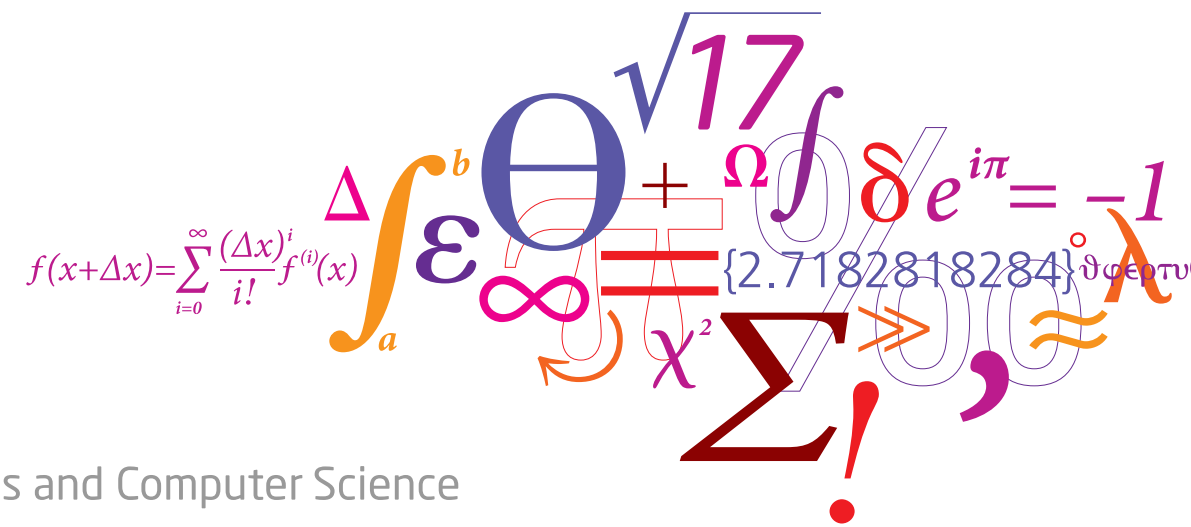
02450: Introduction to Machine Learning and Data Mining

Data, feature extraction and PCA

Mikkel N. Schmidt

DTU Compute, Technical University of Denmark (DTU)



DTU Compute
Department of Applied Mathematics and Computer Science

Lecture Schedule

1. Introduction
   7 October: C1

Data: Feature extraction, and visualization

2. **Data, feature extraction and PCA**
   7 October: C2, C3
3. Measures of similarity, summary statistics and probabilities
   7 October: C4, C5
4. Probability densities and data Visualization
   7 October: C6, C7

Supervised learning: Classification and regression

5. Decision trees and linear regression
   8 October: C8, C9
6. Overfitting, cross-validation and Nearest Neighbor
   8 October: C10, C12
7. Performance evaluation, Bayes, and Naive Bayes
   9 October: C11, C13
8. Artificial Neural Networks and Bias/Variance
   9 October: C14, C15
9. AUC and ensemble methods
   10 October: C16, C17

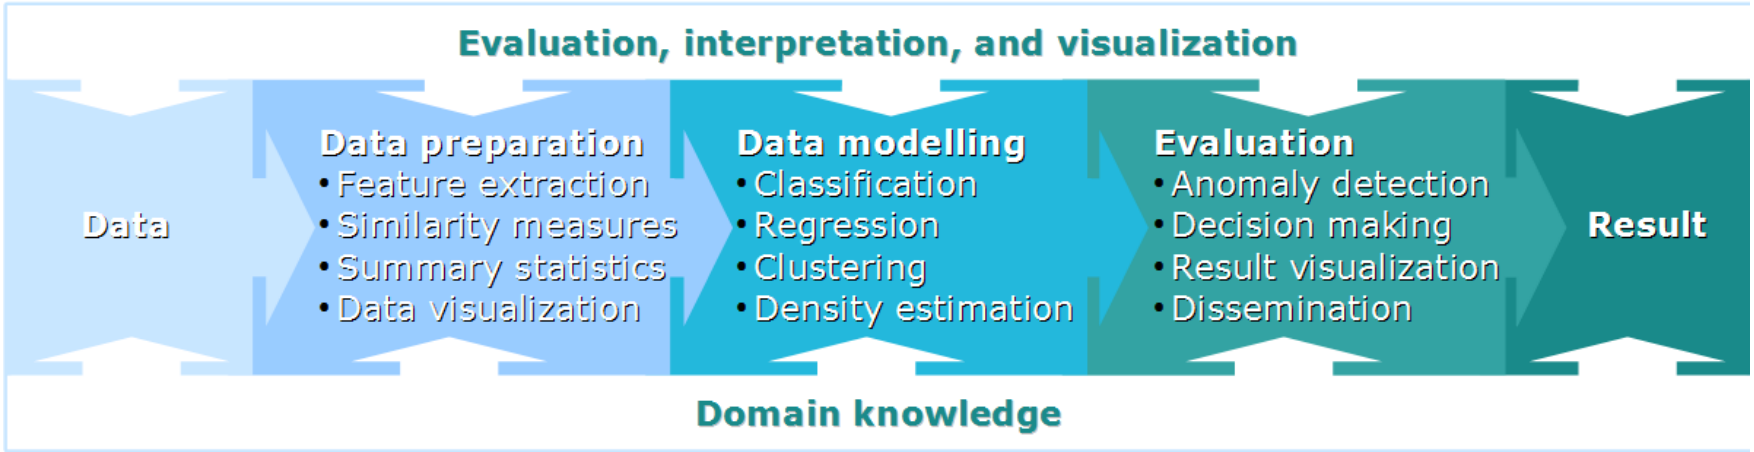
Unsupervised learning: Clustering and density estimation

10. K-means and hierarchical clustering
    10 October: C18
11. Mixture models and density estimation
    11 October: C19, C20
12. Association mining
    11 October: C21

Recap

13. Recap
    11 October: C1-C21

Piazza online help: `https://piazza.com/dtu.dk/fall2019/october2019`



Learning Objectives

- Understand the types of data, their attributes and data issues
- Be able to apply principal component analysis for data visualization and feature extraction

What is data?

- Collection of data objects and their attributes
- An attribute is a property or characteristic of an object
  - Also known as variable, field, characteristic, or feature
- Collection of attributes describe an object
  - Also known as record, point, case, sample, entity, or instance

Attributes

Data objects

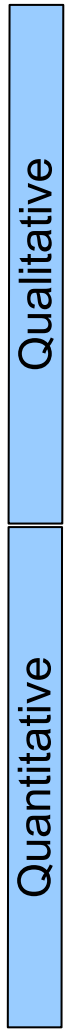
ID	Age	Gender	Name
1	31	F	Alex
2	24	M	Ben
3	52	F	Cindy
4	35	M	Dan
5	58	M	Eric
6	46	F	Fay
7	42	M	George

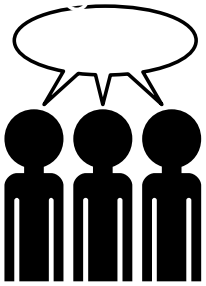
Discrete / continuous attributes

- **Discrete**
  - Finite (or countably infinite) set of values
  - Examples:
    - Zip codes
    - Counts
    - Set of words in a collection of documents
  - Often represented as integer variables
- **Continuous**
  - Has real numbers as attribute values
  - Examples:
    - Temperature
    - Height
    - Weight.
  - Often represented as floating point variables

Types of attributes

- **Nominal:** Objects belong to a category (Equal / Not equal)
  - ID numbers
  - Eye color
  - Zip codes
- **Ordinal:** Objects can be ranked (Greater than / Less than)
  - Taste of potato chips on a scale from 1-10
  - Grades
  - Height in {short, medium, tall}
- **Interval:** Distance between objects can be measured (Addition / Subtraction)
  - Calendar dates
  - Temperature in Fahrenheit and Celcius
- **Ratio:** Zero means absence of what is measured (Multiplication / Division)
  - Length
  - Time
  - Counts
  - Temperature in Kelvin





Discussion

- **Classify the following attributes**
  a) Military rank
  b) Angles measured in degrees
  c) A persons year of birth
  d) A persons age in years
  e) Coat check number
  f) Distance from center of campus
  g) Number of patients in a hospital

- **Discrete**
  - Finite (or countably infinite) set of values
- **Continuous**
  - Real number

- **Nominal** (Equal / Not equal)
  - Objects belong to a category
- **Ordinal** (Greater than / Less than)
  - Objects can be ranked
- **Interval** (Addition / Subtraction)
  - Distance between objects can be measured
- **Ratio** (Multiplication / Division)
  - Zero means absence of what is measured

Types of data sets

- **Record data**
  - Collection of data objects and their attributes
  - Representation: Table
- **Relational data**
  - Collection of data objects and their relation
  - Representation: Graph
- **Ordered data**
  - Ordered collection of data objects
  - Representation: Sequence

Record data example: Market basket data

- **Transaction data table**

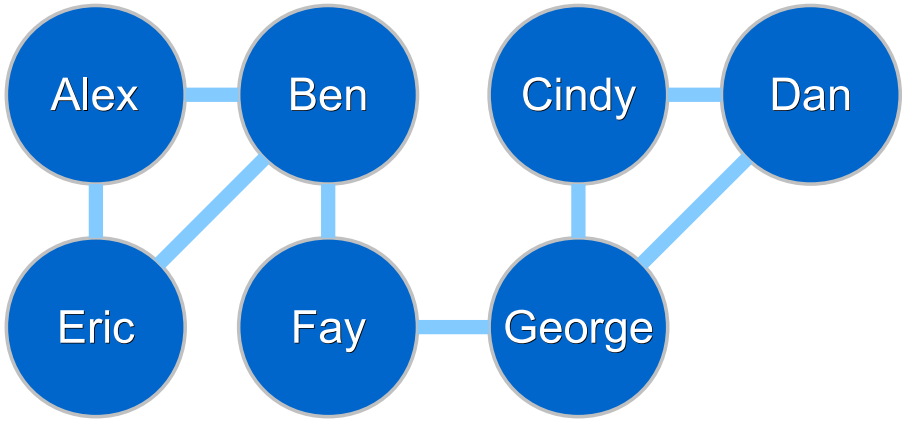
ID	Items
1	Bread, Soda, Milk
2	Beer, Bread
3	Beer, Soda, Diaper, Milk
4	Beer, Bread, Diaper, Milk
5	Soda, Diaper, Milk

- **Matrix**

ID	Bread	Soda	Milk	Beer	Diaper
1	1	1	1	0	0
2	1	0	0	1	0
3	0	1	1	1	1
4	1	0	1	1	1
5	0	1	1	0	1

Relational data example: Who knows who?

- **Graph**

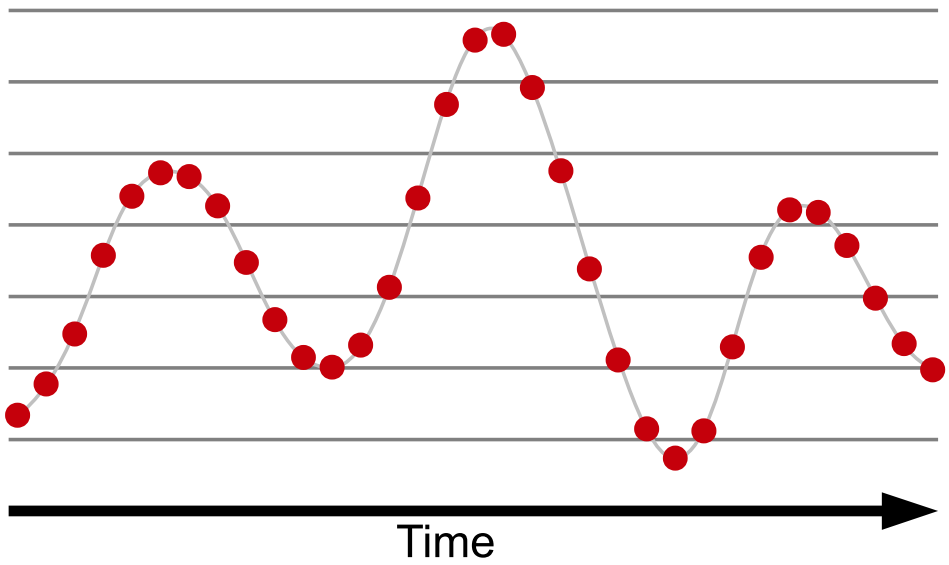


- **Matrix**

	A	B	C	D	E	F	G
A	0	1	0	0	1	0	0
B	1	0	0	0	1	1	0
C	0	0	0	1	0	0	1
D	0	0	1	0	0	0	1
E	1	1	0	0	0	0	0
F	0	1	0	0	0	0	1
G	0	0	1	1	0	1	0

Ordered data example: Time series

- **Sequence**



- **Matrix**

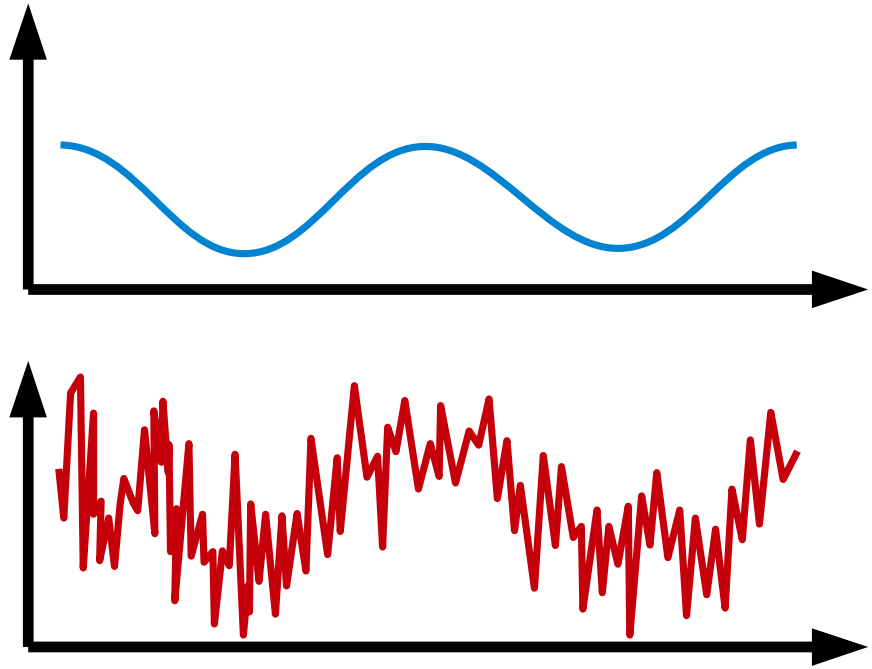
Time	Value
0	1.3
1	1.8
2	2.5
3	3.6
4	4.4
5	4.7
6	4.6
7	4.3
8	2.4
9	2.1
10	2.0
11	2.3
12	3.1

Data quality

- **Data is of high quality if they**
  - Are fit for their intended use
  - Correctly represent the phenomena they correspond to
- **Examples of quality problems**
  - Noise
  - Outliers
  - Missing values

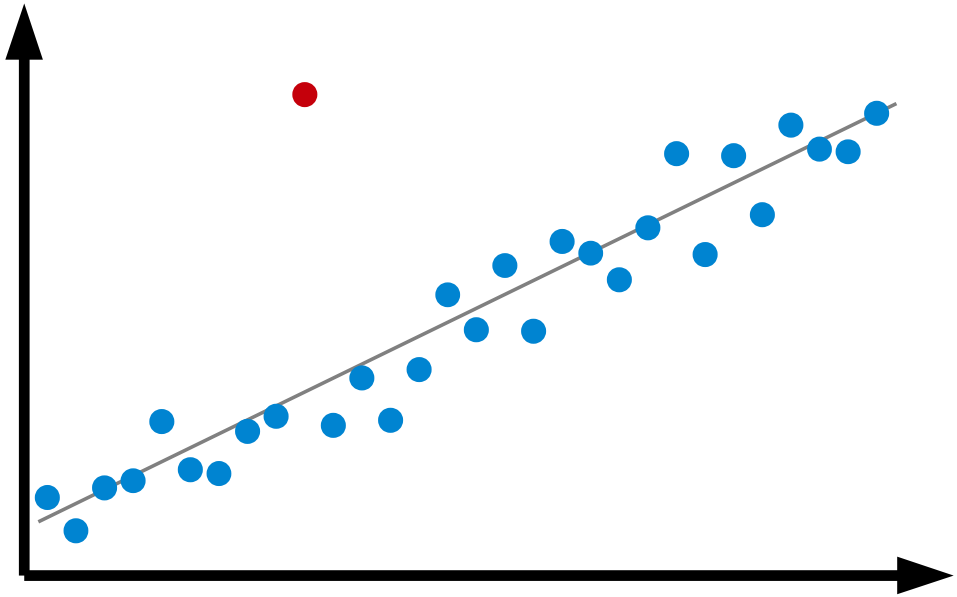
Noise

- **Definition**
  - Unwanted pertubation to a signal
  - Unwanted data
- **Reasons for noise**
  - Limits in measurement accuracy
  - Interference from other signals
  - Measurement of attributes not related to the data modeling task
- **Handling noise**
  - Exclude noisy attributes
  - Remove noise by filtering
  - Include a model of the noise



Outliers

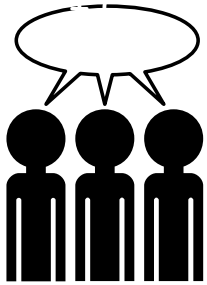
- **Definition**
  - Data objects which are significantly different from most others
- **Reasons for outliers**
  - Measurement error
  - Natural property of data
- **Handling outliers**
  - Identify & exclude outliers
  - Model the outliers



Missing values

- **Definition**
  - No value is stored for an attribute in a data object
- **Reasons for missing values**
  - Information is not collected
    - People decline to give their age
  - Attribute is not applicable
    - Annual income is not applicable to children
- **Handling missing values**
  - Eliminate data objects
  - Estimate missing values (e.g. an average)
  - Ignore the missing value in analysis

ID	Age	Gender	Name
1	31	F	Alex
2	(?)	M	Ben
3	52	F	Cindy
4	35	(?)	Dan
5	(?)	M	Eric
6	(?)	F	Fay
7	42	M	(?)



Discussion

- A group of people were asked to write how many children they have
  - Their response was this

- A research assistant typed the results into a table
  - His table looked like this

Children	3	1	0	2	7	5	15	0	1	3	-2	0	0	0	1

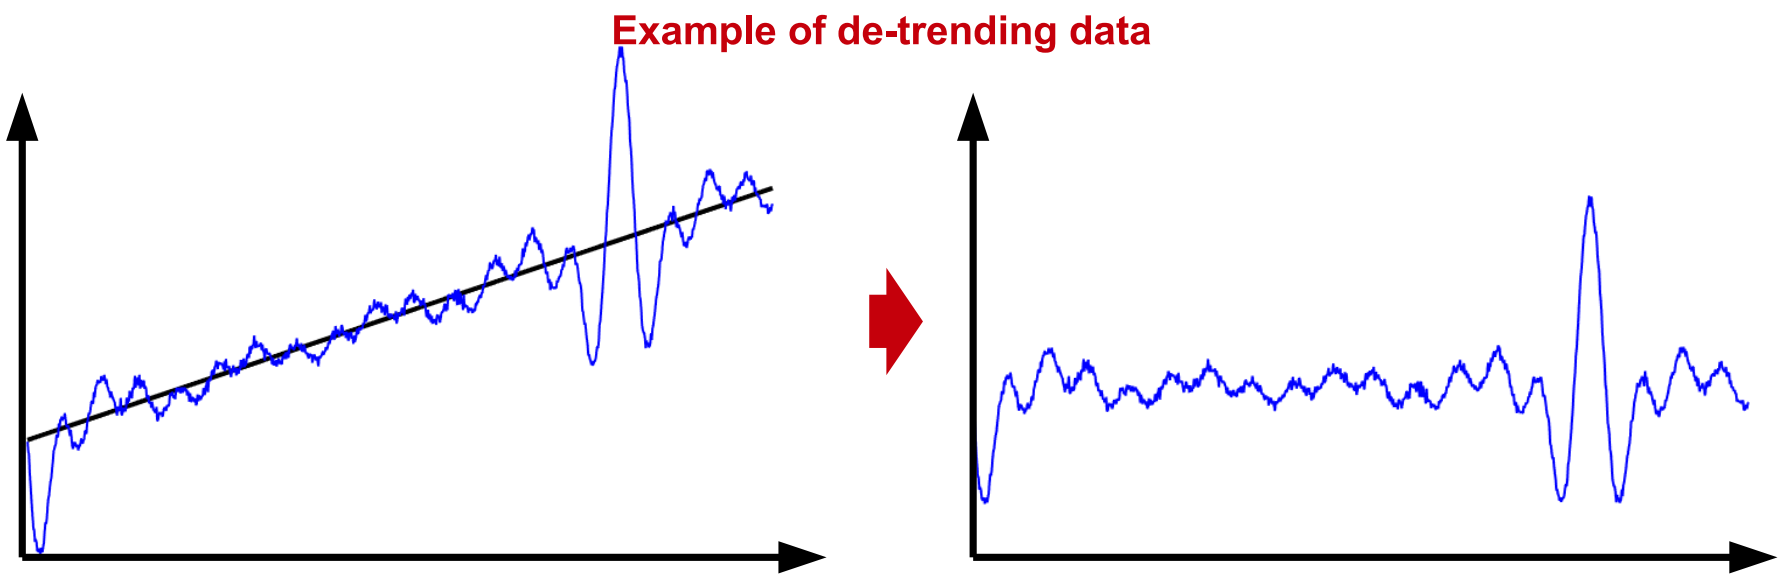
- Are there any data quality issues?
  - Noise?
  - Outliers?
  - Missing values?
- Why have these issues occured, and how should they be handled?

Dataset manipulations

- **Sampling**
  - Selecting a representative subset of data points
- **Feature subset selection**
  - Choose a subset of attributes
- **Feature extraction/transformation**
  - Create new features from existing attributes
  - Discretization and binarization
  - Apply a fixed transformation to an attribute
  - Aggregation several attributes into a single attribute
- **Dimensionality reduction**
  - Project data to a low-dimensional subspace

Feature processing

- Eliminating, suppressing, or attenuating certain aspects of the data
  - Noise removal in audio signals
  - Elimination of common words in text documents
  - Removal of background in images
  - Removal of examples which are corrupted
  - De-trending data (if it is not stationary)



Common feature transformations

ID	MPG	Cylinders	Horsepower	Weight	Year	Safety	Acceleration	Origin
1	18	8	150	3436	70	4	11	France
2	28	4	79	2625	82	4	18.6	USA
3	26	4	79	2255	76	3	17.7	USA
3	29	4	70	1937	76	1	14.2	Germany
4	NaN	8	175	3850	70	2	11	USA
5	24	4	90	2430	70	3	14.5	Germany
6	17.5	6	95	3193	76	4	17.8	USA
7	25	4	87	2672	70	-100	17.5	France
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
142	15	8	198	4341	70	2	10	USA

$$\boldsymbol{X} = \begin{bmatrix} 18 & 8 & 150 & 3436 & 70 & 4 & 11 & 3 \\ 28 & 4 & 79 & 2625 & 82 & 4 & 18.6 & 1 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 15 & 8 & 198 & 4341 & 70 & 2 & 10 & 1 \end{bmatrix}$$

Standardize:

$$\boldsymbol{X} = \begin{bmatrix} \cdots & (X_{1j} - \hat{\mu}_j)/\hat{\sigma}_j & \cdots \\ \cdots & (X_{2j} - \hat{\mu}_j)/\hat{\sigma}_j & \cdots \\ & \vdots & \\ \cdots & (X_{Nj} - \hat{\mu}_j)/\hat{\sigma}_j & \cdots \end{bmatrix}$$

$$\hat{\mu}_j = \frac{1}{N}\sum_{i=1}^{N} X_{ij}, \quad \hat{\sigma}_j = \sqrt{\frac{1}{N-1}\sum_{i=1}^{N}(X_{ij} - \mu_j)^2}$$

Binarize/threshold:

$$\boldsymbol{X} = \begin{bmatrix} \cdots & 1_{[\theta,\infty[}(x_{1j}) & \cdots \\ \cdots & 1_{[\theta,\infty[}(x_{2j}) & \cdots \\ & \vdots & \\ \cdots & 1_{[\theta,\infty[}(x_{Nj}) & \cdots \end{bmatrix}$$

$$1_{[\theta,\infty[}(x) = 1 \text{ if } x \geq \theta \text{ otherwise } 0$$

One-out-of K encoding

One-out-of-K coding

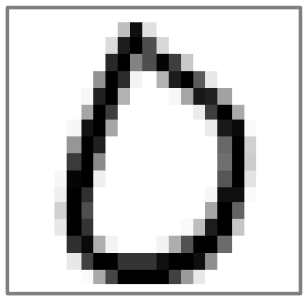
0.1837	0.4669	-0.2741	1	0	0

Image representation

- **Example: Handwritten digits**
- Preprocessing
  - Digitalization
  - Centering
  - Rotation
  - Scaling



28×28

$$M_0 = \begin{bmatrix} 0 & \dots & 0 & 0 & 0 & 0 & \dots & 0 \\ 0 & \dots & 0.3 & 1 & 0.2 & 0 & \dots & 0 \\ \vdots & & & & & & & \vdots \\ 0 & \dots & 0 & 0 & 0 & 0 & \dots & 0 \end{bmatrix}$$

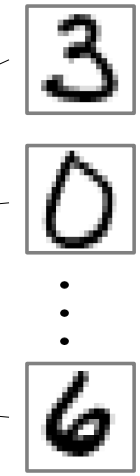
- Vectorization

1×784

$$x_0 = \begin{bmatrix} 0 & \cdots\cdots & 0 & 0.3 & 1 & 0.2 & 0 & \cdots\cdots & 0 \end{bmatrix}^\top$$

- Matrix representation of data set

$$\boldsymbol{X} = \begin{bmatrix} \text{—} & \boldsymbol{x}_1 & \text{—} \\ \text{—} & \boldsymbol{x}_2 & \text{—} \\ & \vdots & \\ \text{—} & \boldsymbol{x}_N & \text{—} \end{bmatrix}$$

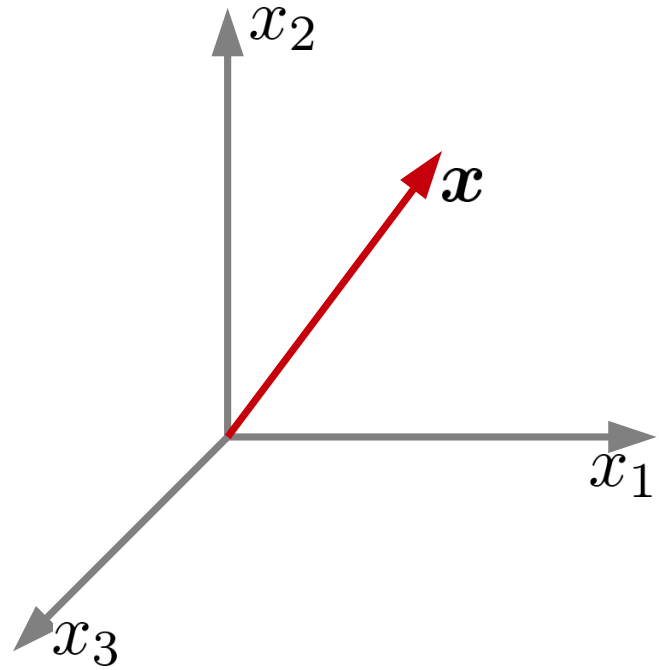


If each image is 28×28 pixels then $\boldsymbol{X}$ is a $N \times 784$ matrix.

Vector space representation

- All these data objects have a vector space representation

$$\boldsymbol{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_M \end{bmatrix}$$



Plan for the rest of today:

- Linear algebra recap (subspaces and projections)
- The goal of Principal Component Analysis (PCA)
- Derivation of PCA
- Singular Value Decomposition used to implement PCA
- Use of PCA for data visualization

Vectors and matrices

- Common matrix notation

$$\boldsymbol{A}, A, \overline{\overline{A}}$$

$$\boldsymbol{A} = \begin{bmatrix} a_{1,1} & \cdots & a_{1,M} \\ \vdots & & \vdots \\ a_{N,1} & \cdots & a_{N,M} \end{bmatrix} \in \mathbb{R}^{N \times M}$$

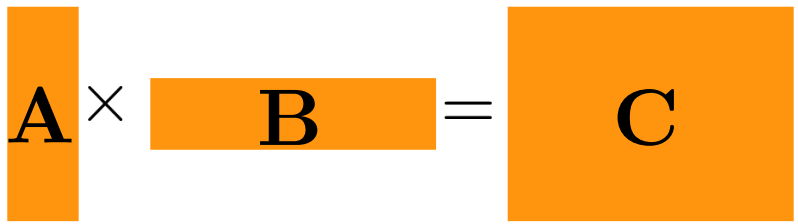
- Common vector notation

$$\boldsymbol{x}, x, \overline{x}, \vec{x}$$

$$\boldsymbol{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_M \end{bmatrix} \in \mathbb{R}^{M}$$

Matrix multiplication

- Two matrices can be multiplied $\boldsymbol{AB} = \boldsymbol{C}$
  - if the number of columns in the first equals the number of rows in the second



$$L \times M \quad M \times N \quad L \times N$$

$$\underset{3\times 4 \text{ matrix}}{\begin{bmatrix} \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ 1 & 2 & 3 & 4 \end{bmatrix}} \underset{4\times 5 \text{ matrix}}{\begin{bmatrix} \cdot & \cdot & \cdot & a & \cdot \\ \cdot & \cdot & \cdot & b & \cdot \\ \cdot & \cdot & \cdot & c & \cdot \\ \cdot & \cdot & \cdot & d & \cdot \end{bmatrix}} = \underset{3\times 5 \text{ matrix}}{\begin{bmatrix} \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & x_{3,4} & \cdot \end{bmatrix}}$$

$$x_{3,4} = 1 \cdot a + 2 \cdot b + 3 \cdot c + 4 \cdot d$$

Example: $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix} = \begin{bmatrix} 19 & 22 \\ 43 & 50 \end{bmatrix}$

Matrix transpose

- The transpose of a matrix

$$\boldsymbol{A} = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 4 & 6 \\ 7 & 8 & 9 \end{bmatrix} \quad \boldsymbol{A}^\top = \begin{bmatrix} 1 & 3 & 7 \\ 2 & 4 & 8 \\ 3 & 6 & 9 \end{bmatrix}$$

- Transpose of a sum

$$(\boldsymbol{A} + \boldsymbol{B})^\top = \boldsymbol{A}^\top + \boldsymbol{B}^\top$$

- Transpose of a product

$$(\boldsymbol{AB})^\top = \boldsymbol{B}^\top \boldsymbol{A}^\top$$

$$(\boldsymbol{Ax})^\top \boldsymbol{y} = \boldsymbol{x}^\top \boldsymbol{A}^\top \boldsymbol{y} = \boldsymbol{x}^\top (\boldsymbol{A}^\top \boldsymbol{y})$$

The identity matrix

- Ones on the diagonal and zeros everywhere else

$$\boldsymbol{I} = \begin{bmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & & 0 \\ \vdots & & \ddots & \vdots \\ 0 & 0 & \cdots & 1 \end{bmatrix} \qquad \boldsymbol{I}^\top = \boldsymbol{I}$$

- Multiplying by the identity does not change anything

$$\boldsymbol{I}\boldsymbol{A} = \boldsymbol{A}$$

$$\boldsymbol{I}_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \quad \boldsymbol{A} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

$$\boldsymbol{I}_2\boldsymbol{A} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

- For a square matrix, the inverse satisfies

$$\boldsymbol{A}\boldsymbol{A}^{-1} = \boldsymbol{A}^{-1}\boldsymbol{A} = \boldsymbol{I}$$

Norms

- The (Euclidian) norm of a vector measures it's length (magnitude):

$$\|\boldsymbol{x}\|_2 = \sqrt{\sum_{n=1}^{N} |x_n|^2} = \sqrt{\boldsymbol{x}^\top \boldsymbol{x}}$$

- The Frobenius norm of a matrix measures it's magnitude:

$$\|\boldsymbol{X}\|_F^2 = \sum_{i,j} x_{i,j}^2 = \mathrm{trace}(\boldsymbol{X}\boldsymbol{X}^T) = \mathrm{trace}(\boldsymbol{X}^T\boldsymbol{X})$$

Where trace takes the sum of the diagonal elements, i.e. $\mathrm{trace}(\boldsymbol{A}) = \sum_{i=1}^{N} a_{i,i}$

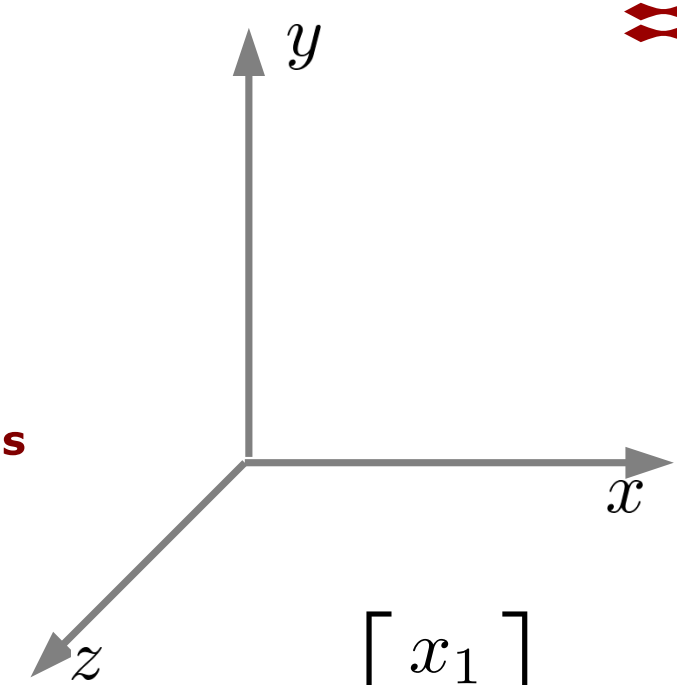
Vector spaces

- A M-dimensional vector space is just $\mathbb{R}^M$
- This is the set of all M-dimensional vectors
- A vector space is closed under **linear combinations**

$$a_1\boldsymbol{x}_1 + a_2\boldsymbol{x}_2 + \cdots + a_n\boldsymbol{x}_n$$

$\boldsymbol{x}_1, \ldots, \boldsymbol{x}_n$ Vectors

$a_1, \ldots, a_n$ Numbers



$$\boldsymbol{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_M \end{bmatrix} \in \mathbb{R}^M$$

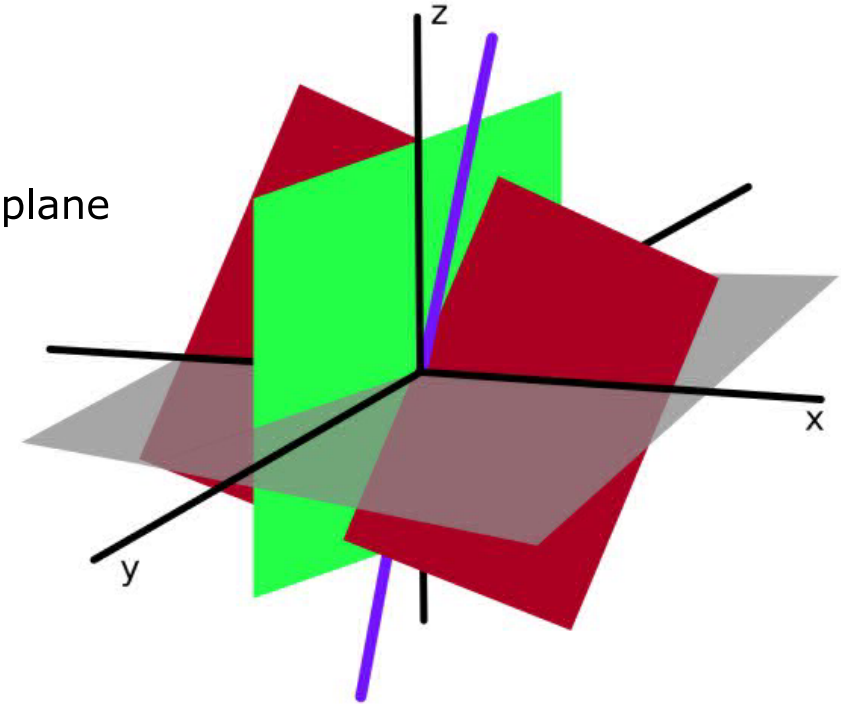
Subspaces

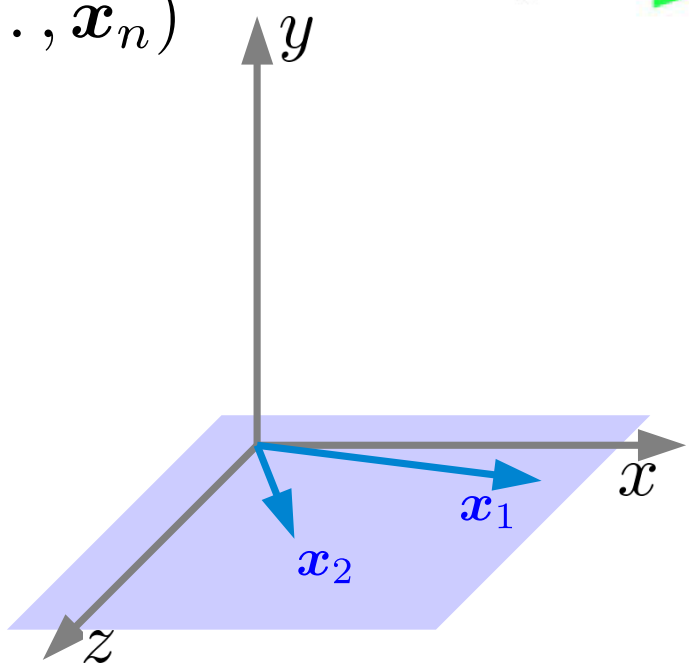
- A **subspace** generalizes the concept of a line/plane
- If we consider n vectors $\boldsymbol{x}_1, \ldots, \boldsymbol{x}_n$ the **span** is then all linear combinations

$$\boldsymbol{z} = a_1\boldsymbol{x}_1 + a_2\boldsymbol{x}_2 + \cdots + a_n\boldsymbol{x}_n$$

and it is said to be a **subspace**

$$\mathrm{V} = \mathrm{span}(\boldsymbol{x}_1, \ldots, \boldsymbol{x}_n)$$





Basis of a (sub)space

- Vectors $\boldsymbol{x}_1, \ldots, \boldsymbol{x}_n$ are said to be **linearly independent** if

$$\mathbf{0} = a_1\boldsymbol{x}_1 + a_2\boldsymbol{x}_2 + \cdots + a_n\boldsymbol{x}_n$$

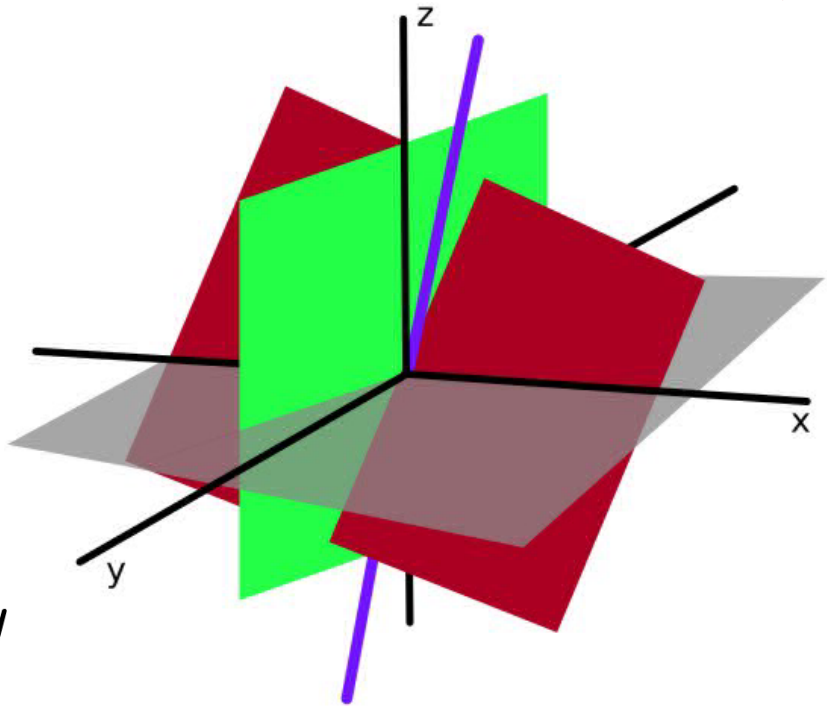
implies $a_1 = a_2 = \cdots = a_n = 0$

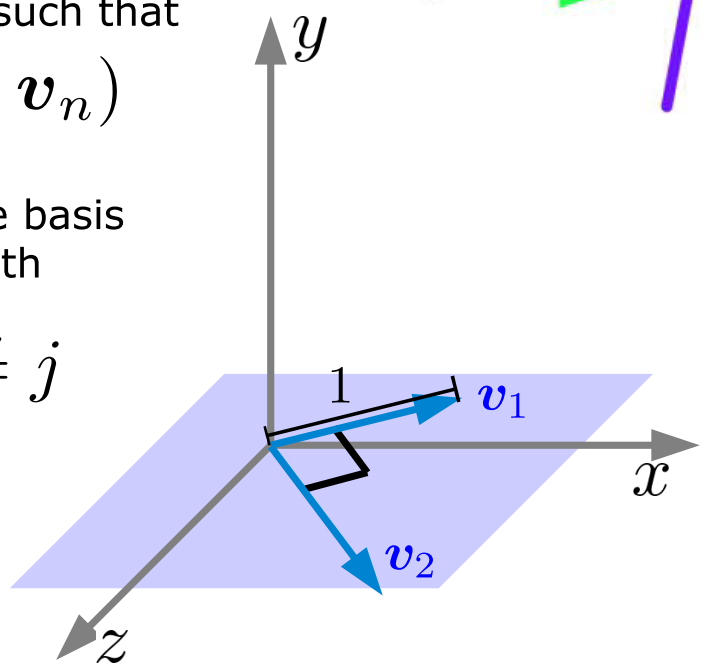
- A **basis** of a vector space V are n linearly independent vectors such that

$$\mathrm{V} = \mathrm{span}(\boldsymbol{v}_1, \ldots, \boldsymbol{v}_n)$$

- A basis is **orthonormal** if the basis is orthogonal and of unit length

$$\boldsymbol{v}_i^T\boldsymbol{v}_j = 0 \text{ for } i \neq j$$
$$\|\boldsymbol{v}_i\| = 1$$





Basis of a (sub)space

- A **basis** of a vector space V are n linearly independent vectors such that

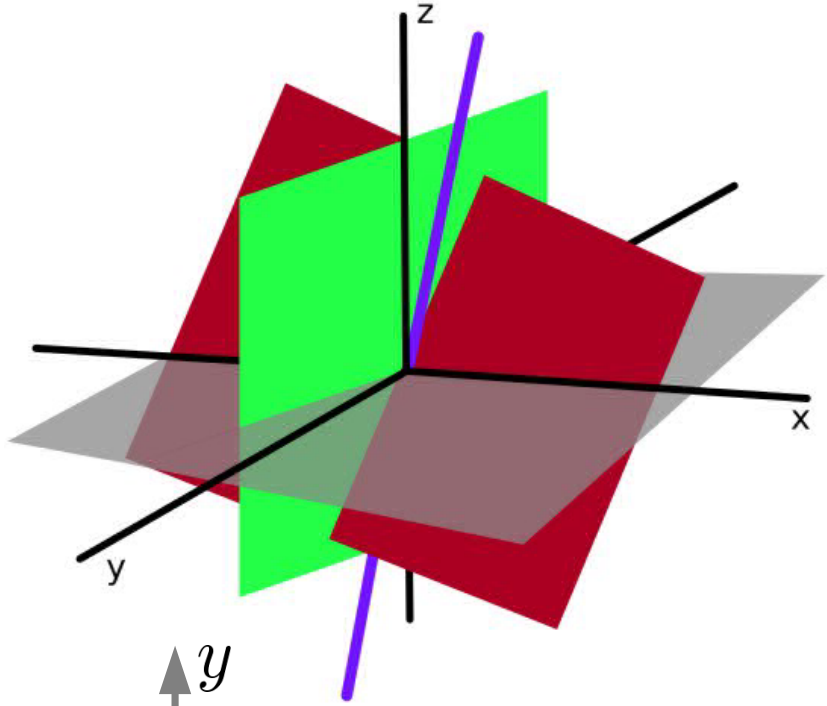
$$\mathrm{V} = \mathrm{span}(\boldsymbol{v}_1, \ldots, \boldsymbol{v}_n)$$

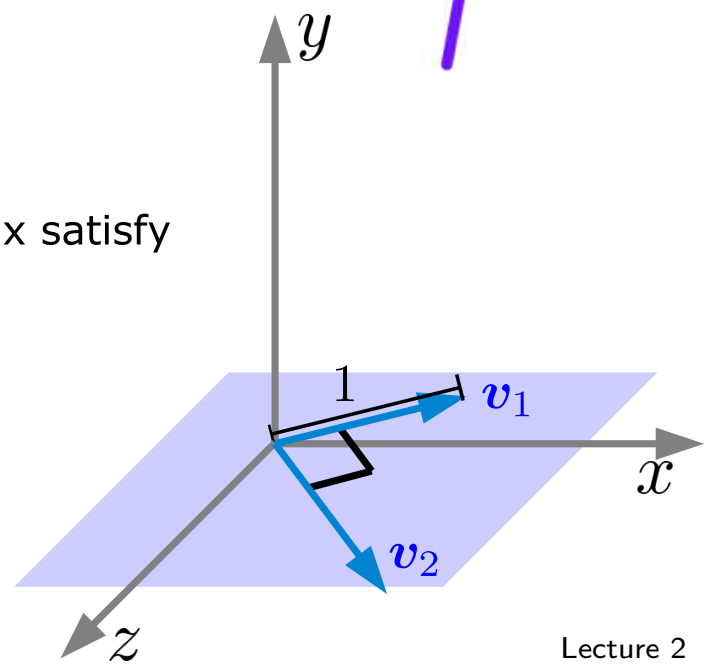
- We collect the basis into a matrix

$$\boldsymbol{V} = \begin{bmatrix} | & | & & | \\ \boldsymbol{v}_1 & \boldsymbol{v}_2 & \cdots & \boldsymbol{v}_N \\ | & | & & | \end{bmatrix}$$

- If the basis is orthonormal the matrix satisfy

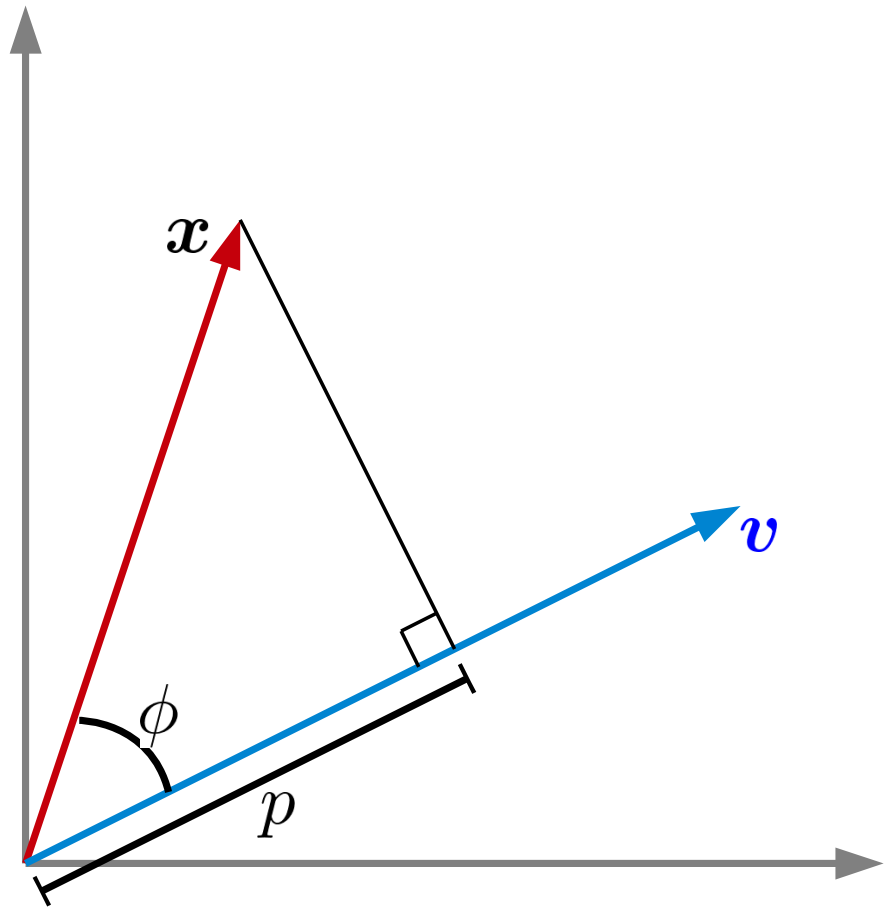
$$\boldsymbol{V}^\top \boldsymbol{V} = \boldsymbol{I}, \quad \boldsymbol{V}^\top = \boldsymbol{V}^{-1}$$





Projection

- Projection onto a vector



- Angle between vectors

$$\cos(\phi) = \frac{\boldsymbol{v}^\top \boldsymbol{x}}{\|\boldsymbol{x}\|_2 \|\boldsymbol{v}\|_2}$$

- Length of projection

$$p = \|\boldsymbol{x}\|_2 \cos(\phi) = \frac{\boldsymbol{v}^\top \boldsymbol{x}}{\|\boldsymbol{v}\|_2}$$

- Projection onto unit vector

$$p = \boldsymbol{v}^\top \boldsymbol{x}$$

Projection onto a subspace

- **Projection onto a subspace**
  - Subspace of dimension n defined by a orthonormal basis matrix $\boldsymbol{V}$
  - Projection of $\boldsymbol{x}$ (M dimensional) onto V given by

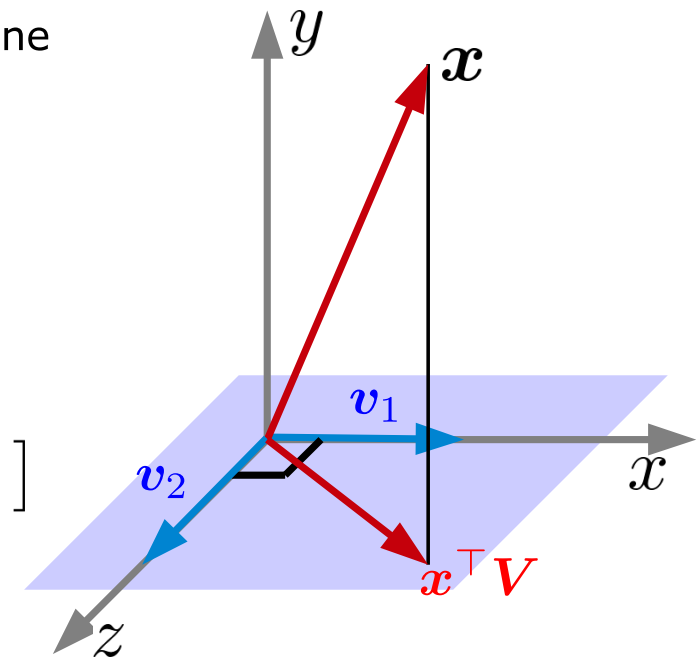
$$\boldsymbol{b}^T = \boldsymbol{x}^T \boldsymbol{V}$$

  - 'Reconstruction' can be found as: $\boldsymbol{x}' = \boldsymbol{V}\boldsymbol{b}$

Example: Projection of 3-D vector onto the (x,z) plane

$$\boldsymbol{V} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix} \qquad \boldsymbol{x} = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$$

$$\boldsymbol{x}^\top V = \begin{bmatrix} x & y & z \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} x & z \end{bmatrix}$$



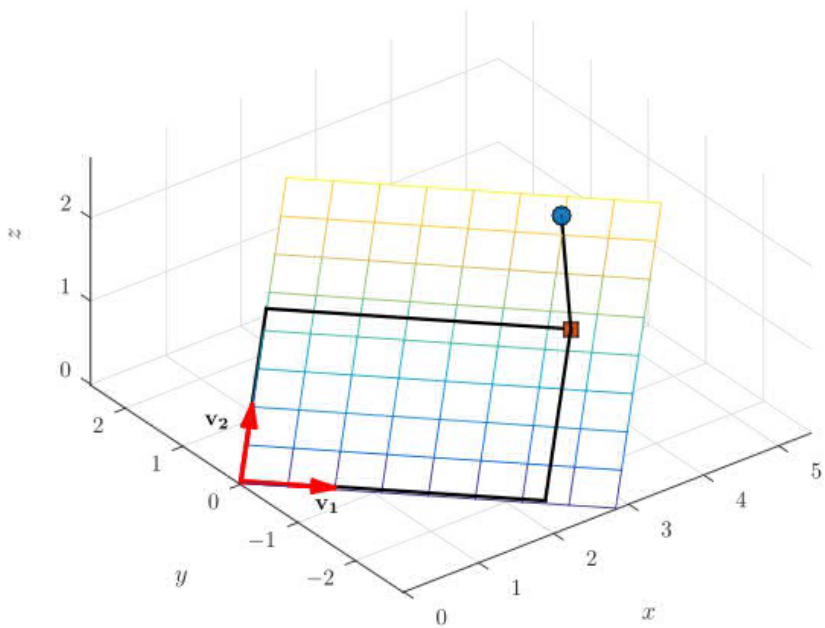
Projection onto a subspace

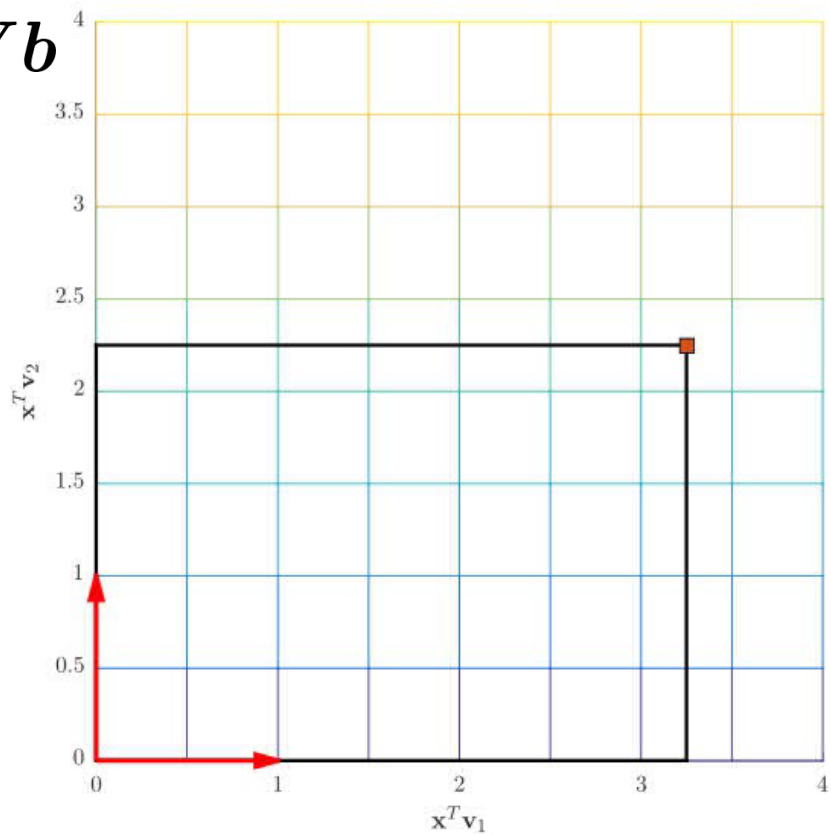
- **Projection onto a subspace**
  - Subspace of dimension n defined by a orthonormal basis matrix $\boldsymbol{V}$
  - Projection of $\boldsymbol{x}$ (M dimensional) onto V given by

$$\boldsymbol{b}^T = \boldsymbol{x}^T \boldsymbol{V}$$

  - 'Reconstruction' can be found as: $\boldsymbol{x}' = \boldsymbol{V}\boldsymbol{b}$

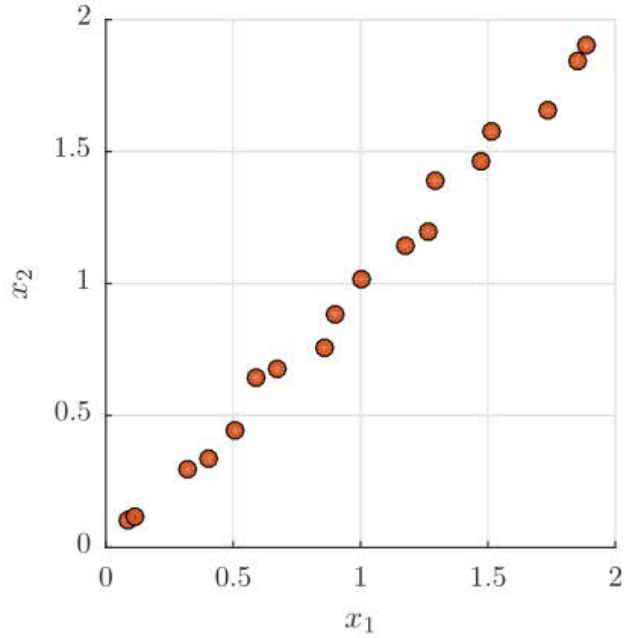
Example 2:





PCA for high-dimensional data

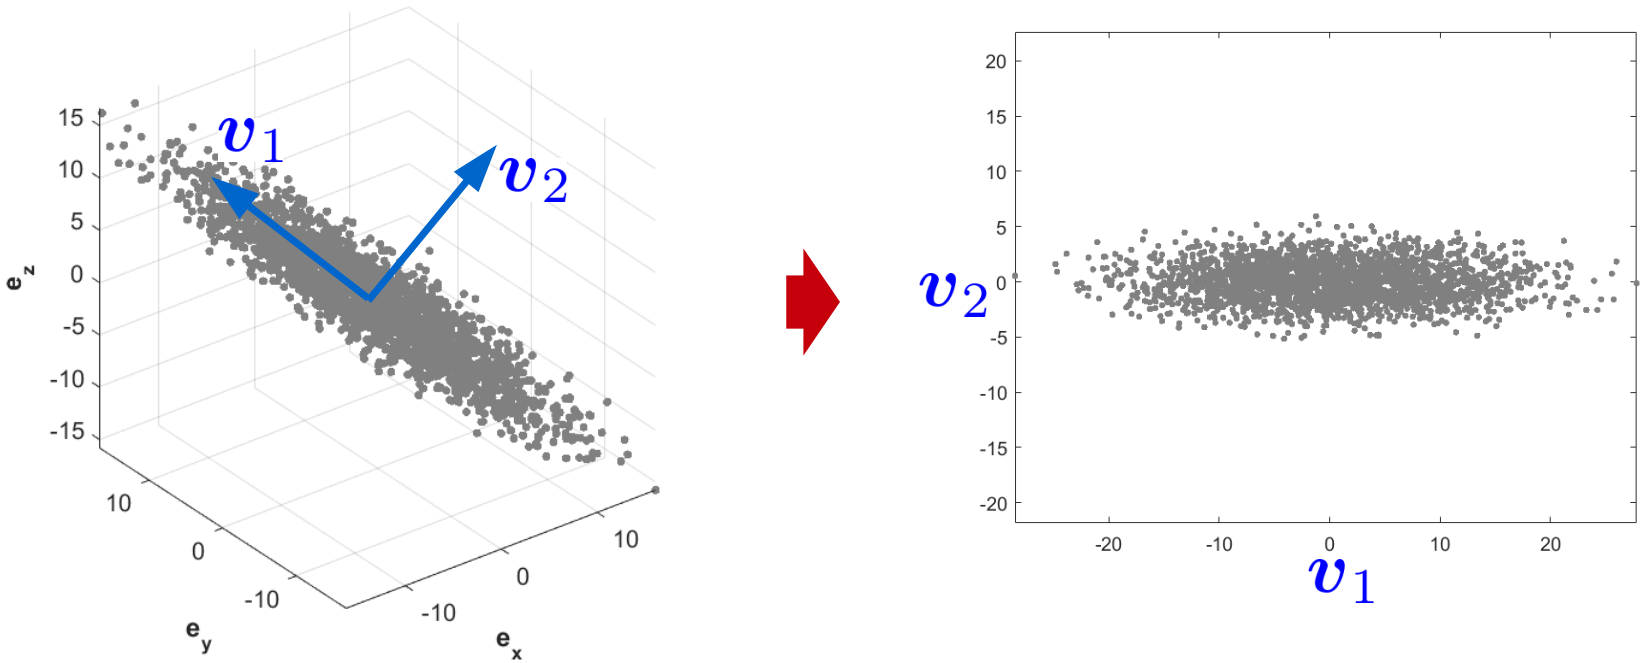
- Much data is high-dimensional
- We want to find a **lower**-dimensional representation of the **high**-dimensional data



(2 dimensional but really 1 dimensional)

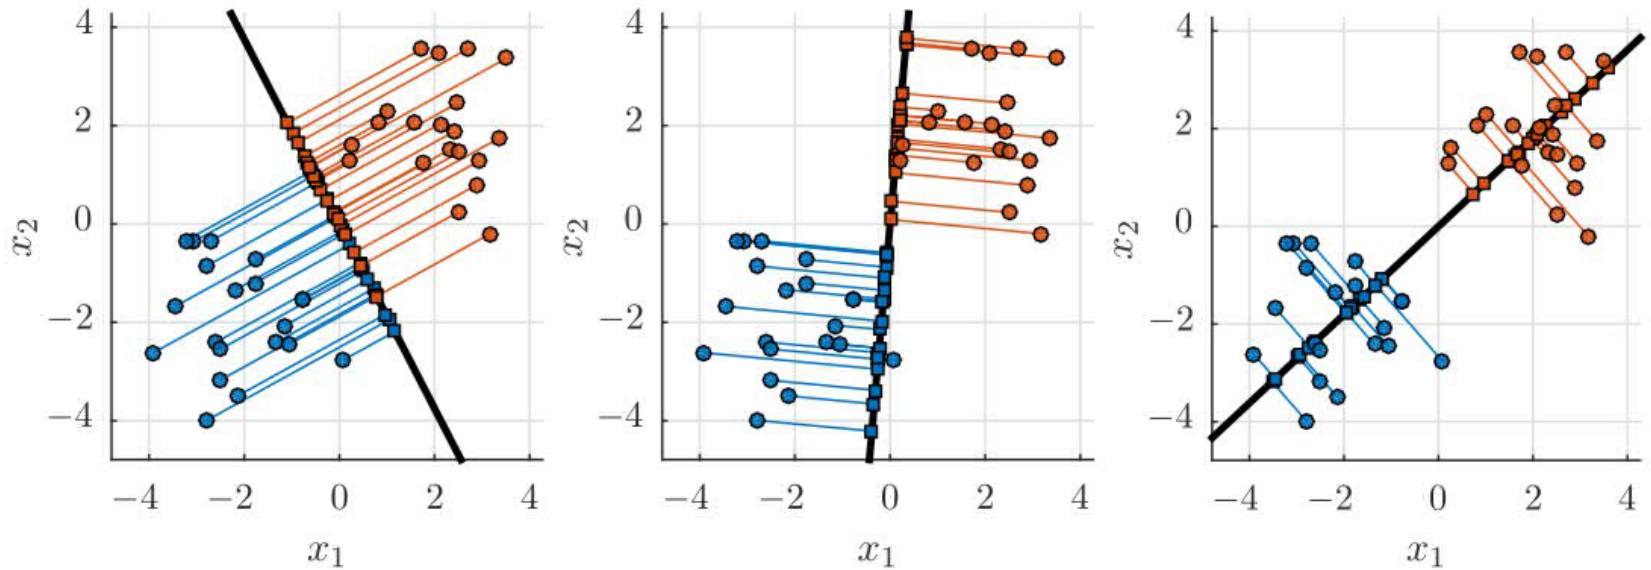
PCA for high-dimensional data

- Much data is high-dimensional
- We can **project high** dimensional data to a **lower** dimensional **subspace**
- But what is a good projection?



PCA for high-dimensional data

- Much data is high-dimensional
- We can project high dimensional data to a lower dimensional subspace
- But what is a good projection?
- Select projection that maximizes the variance of the projected data

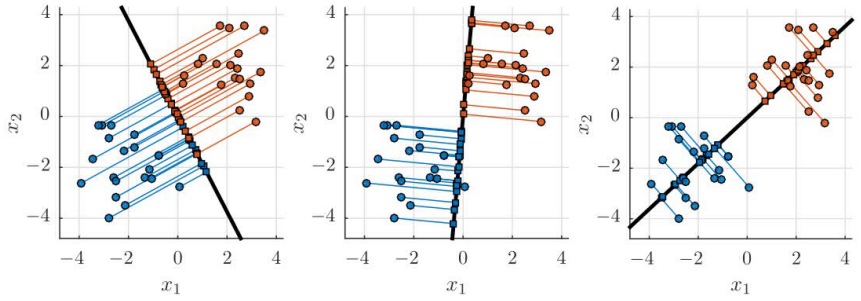


PCA derivation

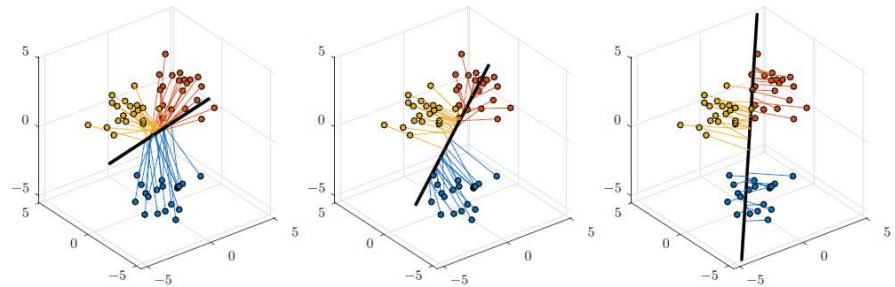
Projection of $\boldsymbol{x}_i$ onto unit vector $\boldsymbol{v}$: $b_i = \boldsymbol{x}_i \boldsymbol{v}$

$$\begin{aligned}
\mathrm{Var}[b] &= \frac{1}{N-1}\sum_{i=1}^{N}\left[b_i - \frac{1}{N}\sum_{j=1}^{N} b_j\right]^2 \\
&= \frac{1}{N-1}\sum_{i=1}^{N}\left[\boldsymbol{x}_i^\top \boldsymbol{v} - \frac{1}{N}\sum_{j=1}^{N} \boldsymbol{x}_j^\top \boldsymbol{v}\right]^2 \\
&= \frac{1}{N-1}\sum_{i=1}^{N}\left[\left(\boldsymbol{x}_i^\top - \frac{1}{N}\sum_{j=1}^{N} \boldsymbol{x}_j^\top\right)\boldsymbol{v}\right]^2 \\
&= \frac{1}{N-1}\sum_{i=1}^{N}\left(\tilde{\boldsymbol{x}}_i^\top \boldsymbol{v}\right)^2 \qquad \boxed{\tilde{\boldsymbol{x}}_i = \boldsymbol{x}_i - \boldsymbol{m}} \\
&= \frac{1}{N-1}\sum_{i=1}^{N}\boldsymbol{v}^\top \tilde{\boldsymbol{x}}_i \tilde{\boldsymbol{x}}_i^\top \boldsymbol{v} = \frac{1}{N-1}\boldsymbol{v}^\top \tilde{\boldsymbol{X}}^\top \tilde{\boldsymbol{X}} \boldsymbol{v}
\end{aligned}$$

2D example



3D example



$\boldsymbol{A}\boldsymbol{v} = \lambda \boldsymbol{v}, \qquad \boldsymbol{A}$ is a $N \times N$ matrix

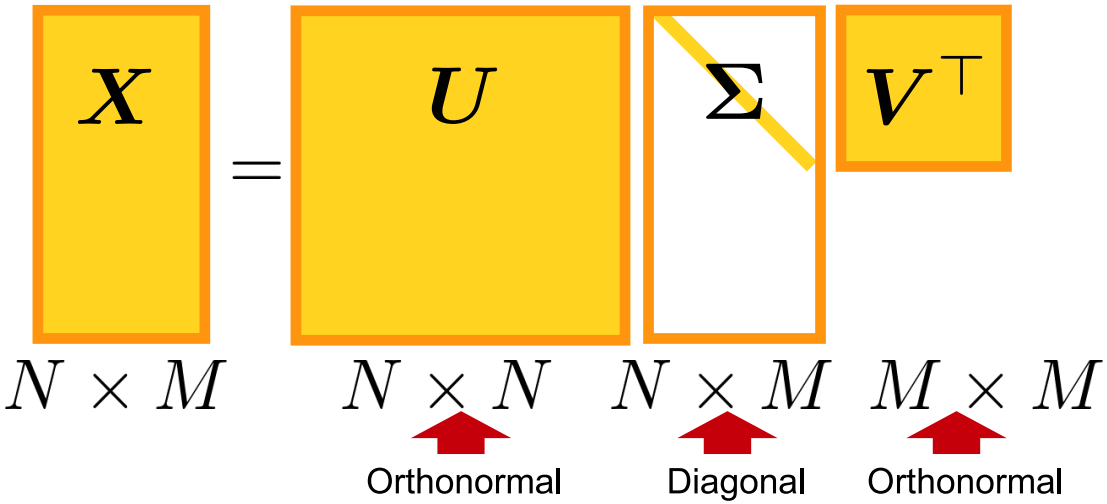
We say $\boldsymbol{v}$ is an eigenvector with eigenvalue λ

The Singular Value Decomposition (SVD)

(Eugino Beltrami & Camille Jordan, independently, 1873-1874)

Any N x M matrix can be decomposed as follows:

$$\boldsymbol{X} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$



$\sigma_1, \ldots, \sigma_M$ is known as the singular values

$$\boldsymbol{\Sigma} = \begin{bmatrix} \sigma_1 & 0 & \cdots & 0 \\ 0 & \sigma_2 & & 0 \\ \vdots & & \ddots & \vdots \\ 0 & 0 & \cdots & \sigma_M \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \cdots & 0 \end{bmatrix}$$

$$\boldsymbol{U} = \begin{bmatrix} \boldsymbol{u}_1 & \cdots & \boldsymbol{u}_N \end{bmatrix} \quad \boldsymbol{V} = \begin{bmatrix} \boldsymbol{v}_1 & \cdots & \boldsymbol{v}_M \end{bmatrix}$$

$$\sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_M \geq 0$$

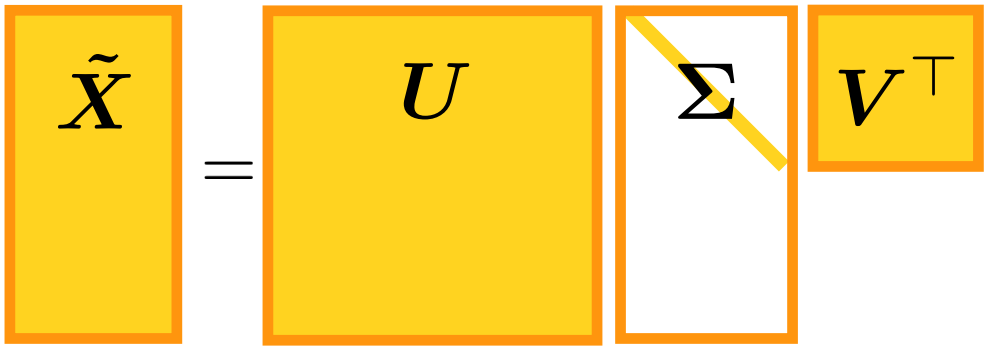
$$\text{if } i \neq j\text{: } \boldsymbol{\Sigma}_{i,j} = 0, \quad \boldsymbol{U}^\top\boldsymbol{U} = \boldsymbol{I}_{N\times N}, \quad \boldsymbol{V}^\top\boldsymbol{V} = \boldsymbol{I}_{M\times M}$$

The Singular Value Decomposition (SVD)

(Eugino Beltrami & Camille Jordan, independently, 1873-1874)

Any N x M matrix can be decomposed as follows:

$$\tilde{\boldsymbol{X}} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$



$$\sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_M \geq 0$$

is known as the singular values

$$\boldsymbol{\Sigma} = \begin{bmatrix} \sigma_1 & 0 & \cdots & 0 \\ 0 & \sigma_2 & & 0 \\ \vdots & & \ddots & \vdots \\ 0 & 0 & \cdots & \sigma_M \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \cdots & 0 \end{bmatrix}$$

$$\begin{aligned} (\tilde{\boldsymbol{X}}^\top \tilde{\boldsymbol{X}})\boldsymbol{v}_i &= (\boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top)^\top \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top)\boldsymbol{v}_i \\ &= (\boldsymbol{V}\boldsymbol{\Sigma}^\top \boldsymbol{U}^\top \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top)\boldsymbol{v}_i \\ &= \boldsymbol{V}\boldsymbol{\Sigma}^\top \boldsymbol{\Sigma}\boldsymbol{e}_i = \sigma_{ii}^2 \boldsymbol{v}_i \end{aligned}$$

$$\boldsymbol{A}\boldsymbol{v} = \lambda \boldsymbol{v}, \qquad \boldsymbol{A} \text{ is a } N \times N \text{ matrix}$$

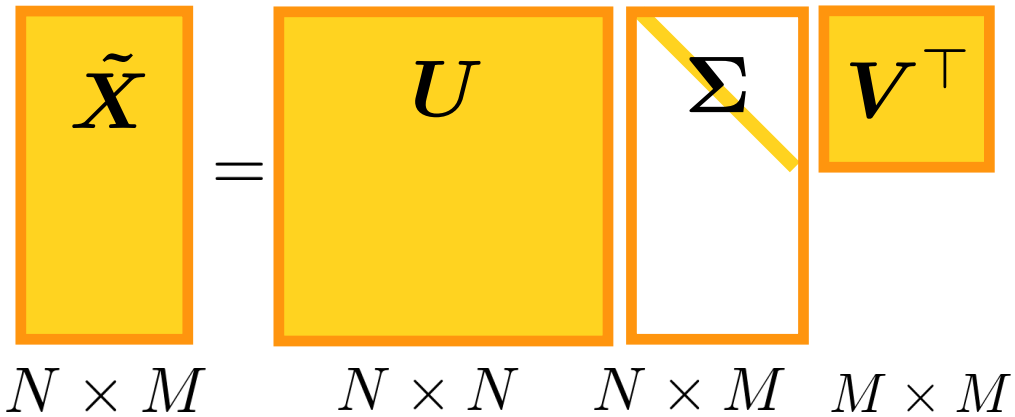
We say $\boldsymbol{v}$ is an eigenvector with eigenvalue λ

Principal component analysis (PCA)

(Karl Pearson, 1901)

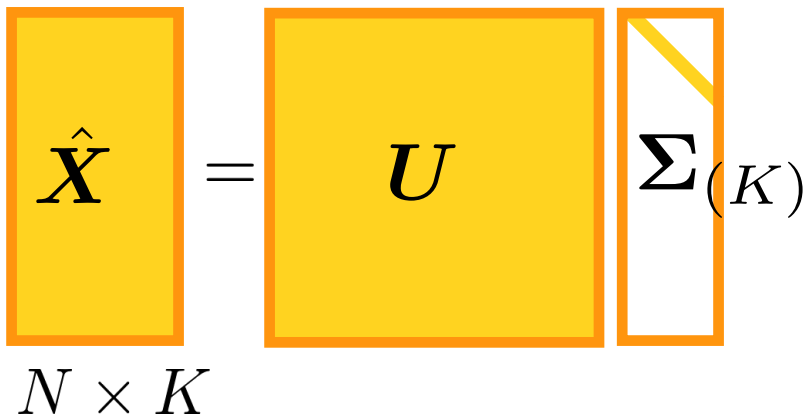
1) Subtract the mean from each observation $\tilde{\boldsymbol{x}}_i = \boldsymbol{x}_i - \boldsymbol{m}$

2) Apply singular value decomposition (SVD) $\tilde{\boldsymbol{X}} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$

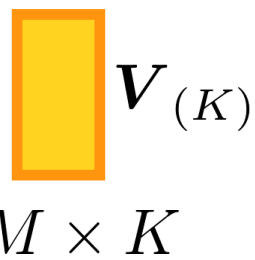


3) Select first K columns of $\boldsymbol{V}$ (the PCA projection operation) and first K columns of $\boldsymbol{\Sigma}$.

$$\boldsymbol{V}_{(K)} = \begin{bmatrix} \boldsymbol{v}_1 & \cdots & \boldsymbol{v}_K \end{bmatrix}$$



(PCA components or PCA projection of the data)



(PCA loadings)

Principal component analysis (PCA)

$$\boldsymbol{X} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$

- Entries in the diagonal matrix $\boldsymbol{\Sigma}$ are called **singular values**
  - They are sorted (largest first)
  - Indicate how much variability is explained by the corresponding component
    - 1st component explains most of the variability
    - 2nd component explains most of the remaining variability

      Etc.

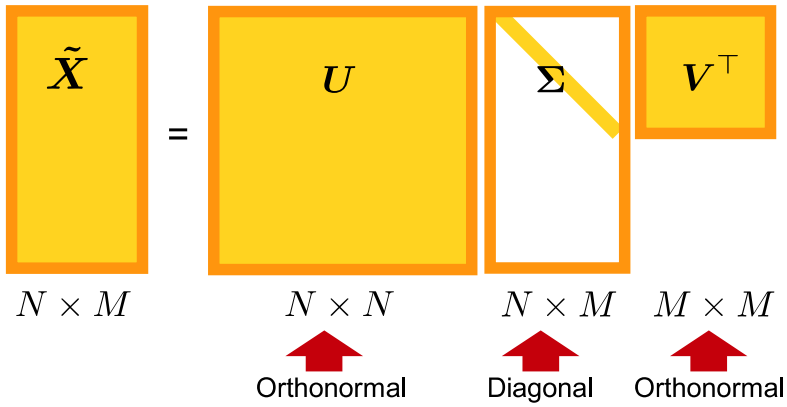
$$\boldsymbol{\Sigma} = \begin{bmatrix} \sigma_1 & 0 & \cdots & 0 \\ 0 & \sigma_2 & & 0 \\ \vdots & & \ddots & \vdots \\ 0 & 0 & \cdots & \sigma_N \end{bmatrix} \qquad \sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_N \geq 0$$

Explained Variance

- We will show that $\|\tilde{\boldsymbol{X}}\|_F^2 = \sum_i \sigma_i^2$

  where $\sigma_i = \boldsymbol{\Sigma}_{i,i}$

$$\tilde{\boldsymbol{X}} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$



$$\|\tilde{\boldsymbol{X}}\|_F^2 = \mathrm{trace}(\tilde{\boldsymbol{X}}\tilde{\boldsymbol{X}}^\top)$$

$$\mathrm{trace}(\boldsymbol{A}\boldsymbol{B}) = \mathrm{trace}(\boldsymbol{B}\boldsymbol{A})$$

Fraction of the variation in the data explained by the i[th] principal component is given by:

$$\frac{\sigma_i^2}{\sum_j \sigma_j^2}$$

And by the first K principal components

$$\frac{\sum_{i=1}^K \sigma_i^2}{\sum_j \sigma_j^2}$$

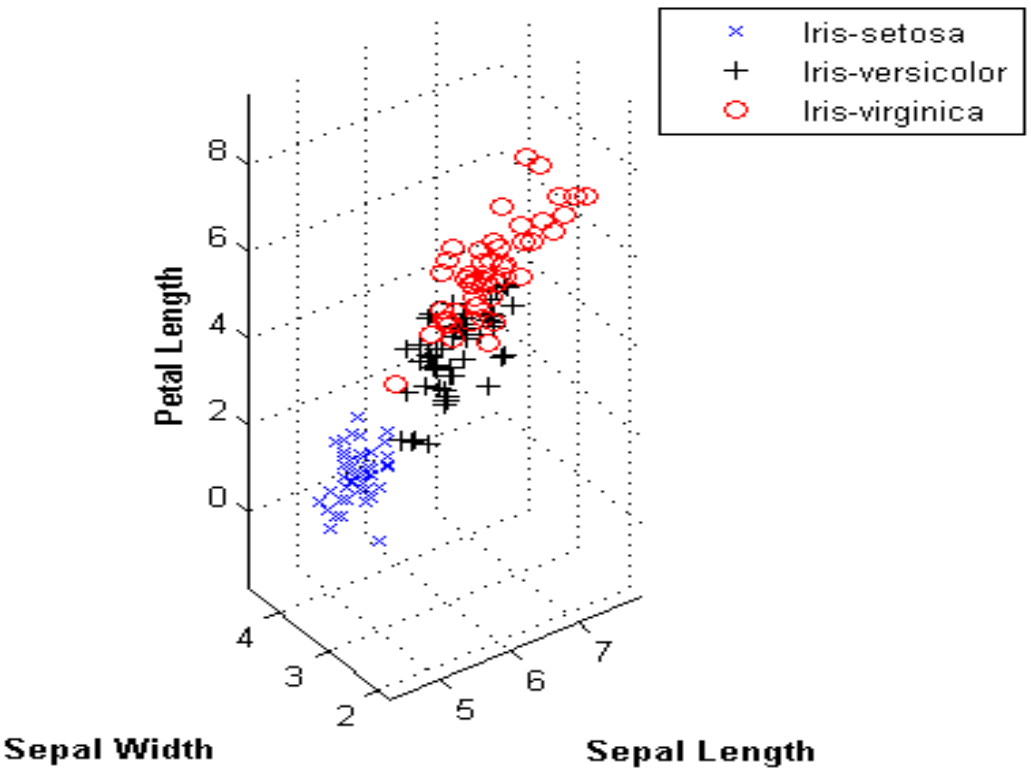
Fishers Iris Data

Three types of flowers:
Iris Setosa, Iris Versicolor, Iris Virginica

Flower ID	Attribute			
	Sepal Length	Sepal Width	Petal Length	Petal Width
1	5.1	3.5	1.4	0.2
2	4.9	3.0	1.4	0.2
3	4.7	3.2	1.3	0.2
4	4.6	3.1	1.5	0.2
.	.	.	.	.
.	.	.	.	.
150	5.9	3.0	5.1	1.8

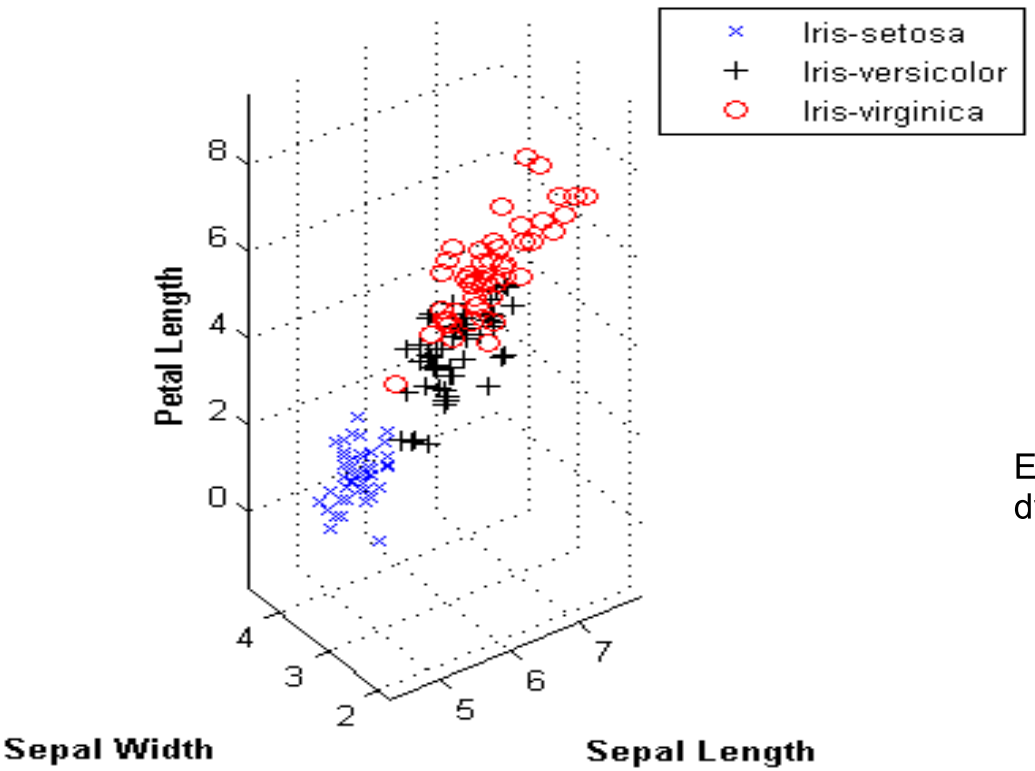
We will presently consider the first 3 attributes, i.e. Sepal length, Sepal Width and Petal Length.

3D scatter plot of Iris Data



What fraction of the total variation in the data will the first principal component account for?

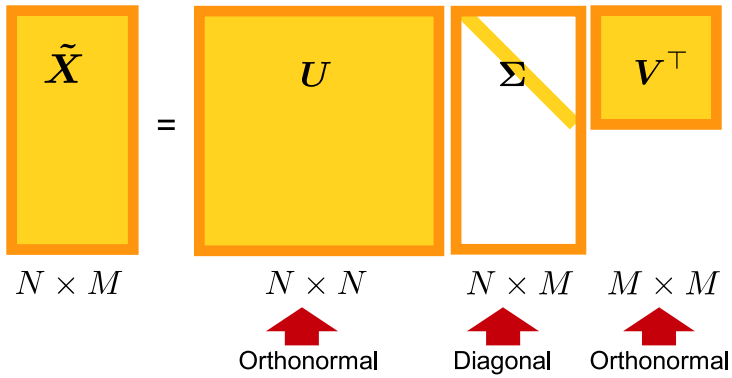
3D scatter plot of Iris Data



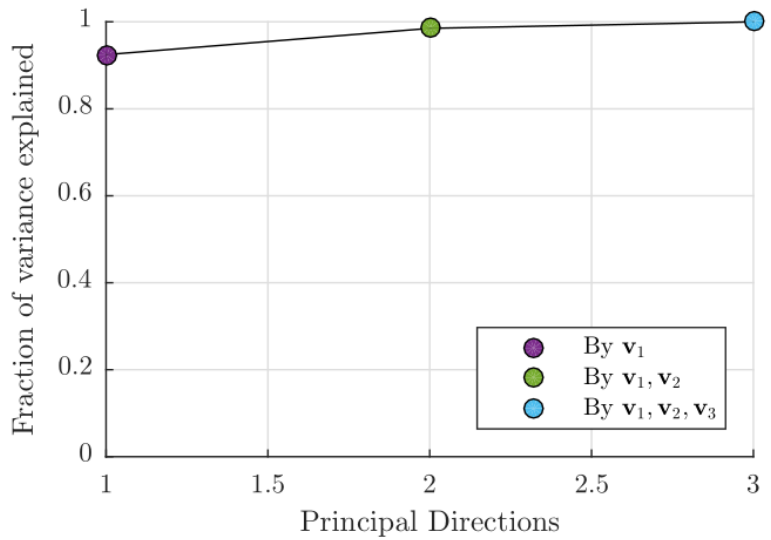
What fraction of the total variation in the data will the first principal component account for?

1) Subtract the mean
2) Apply singular value decomposition (SVD)

$$\tilde{\boldsymbol{X}} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$

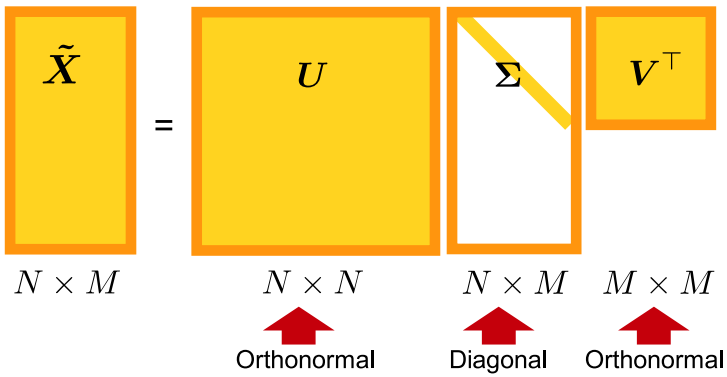


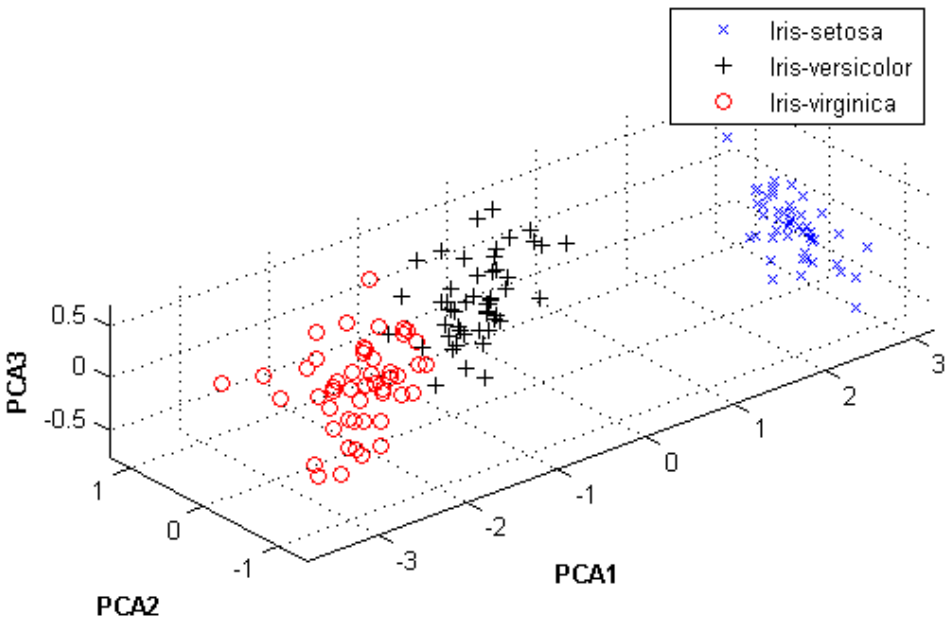
Evaluate the singular values to determine how much of the dynamics is lost when reducing the dimensionality



Visualization of the PCA projections of the data

$$\tilde{\boldsymbol{X}} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$

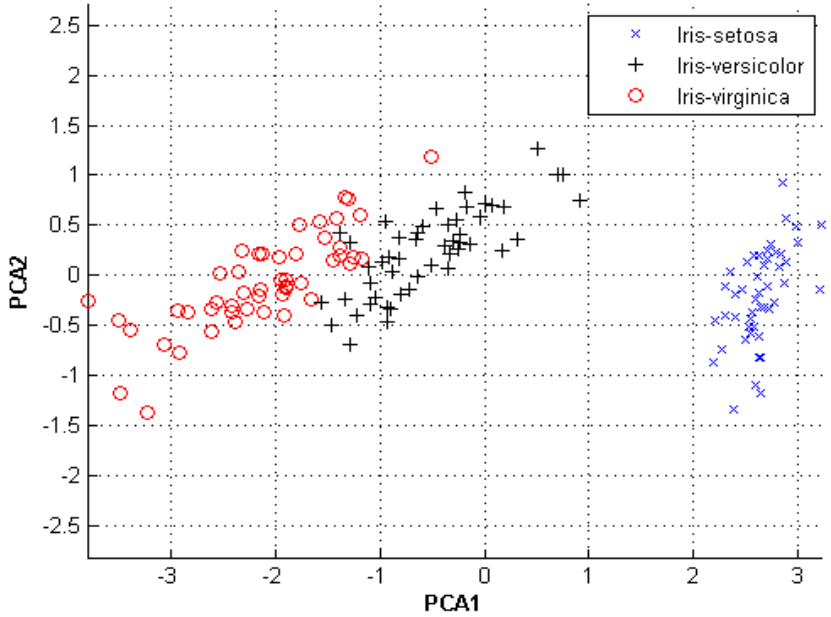




$$PCA1\colon\ \boldsymbol{b}_1 = \tilde{\boldsymbol{X}}\boldsymbol{v}_1 = \boldsymbol{u}_1\sigma_1$$

$$PCA2\colon\ \boldsymbol{b}_2 = \tilde{\boldsymbol{X}}\boldsymbol{v}_2 = \boldsymbol{u}_2\sigma_2$$

$$PCA3\colon\ \boldsymbol{b}_3 = \tilde{\boldsymbol{X}}\boldsymbol{v}_3 = \boldsymbol{u}_3\sigma_3$$



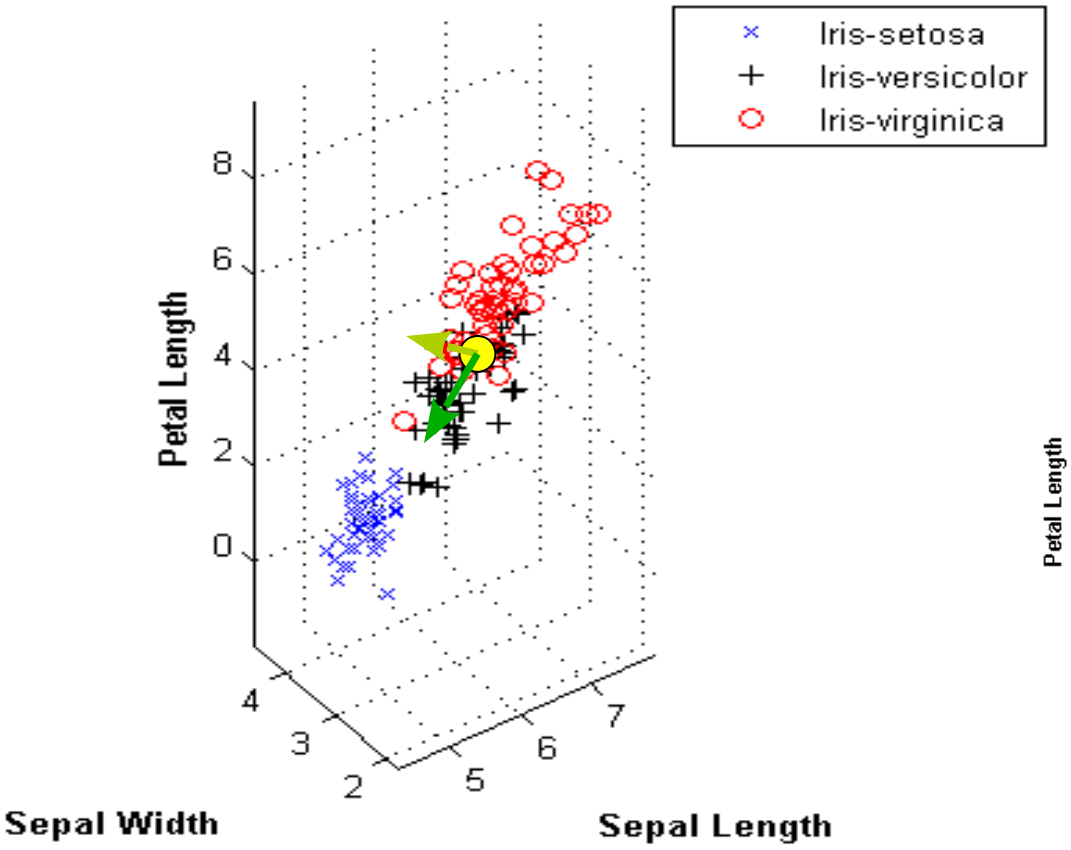
The principal directions V

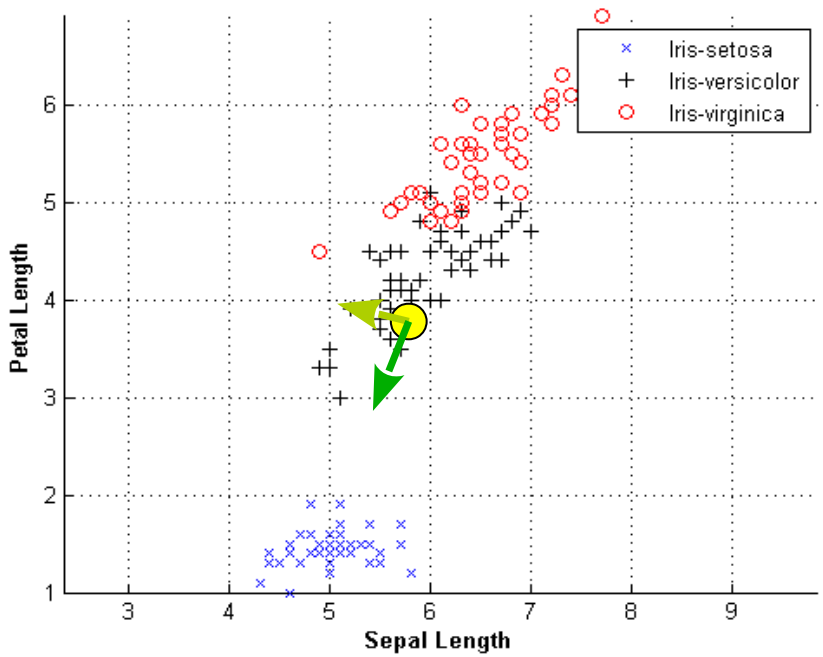
Sepal Length
Sepal Width
Petal Length

$$\boldsymbol{V} = \begin{bmatrix} -0.39 & -0.64 & -0.66 \\ 0.09 & -0.74 & 0.66 \\ -0.92 & 0.20 & 0.35 \end{bmatrix}$$

$$\mu = \begin{bmatrix} 5.8 \\ 3.1 \\ 3.8 \end{bmatrix}, \quad \vec{v}_1 = \begin{bmatrix} -0.39 \\ 0.09 \\ -0.92 \end{bmatrix}, \quad \vec{v}_2 = \begin{bmatrix} -0.64 \\ -0.74 \\ 0.20 \end{bmatrix}$$

Sepal Length
Sepal Width
Petal Length





Visualization of hand written digits

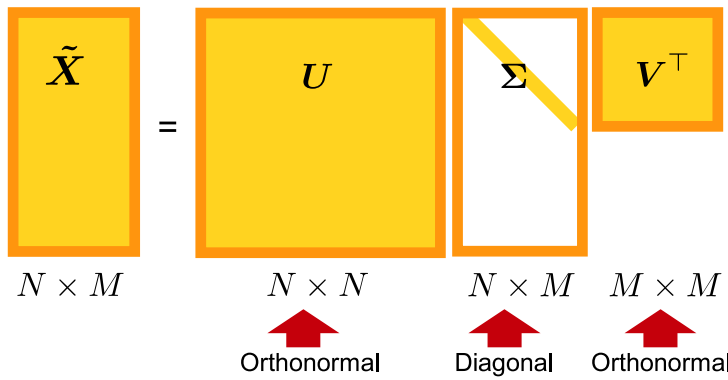
- Data matrix

$$\boldsymbol{X} = \begin{bmatrix} \text{—} & \boldsymbol{x}_1 & \text{—} \\ \text{—} & \boldsymbol{x}_2 & \text{—} \\ & \vdots & \\ \text{—} & \boldsymbol{x}_N & \text{—} \end{bmatrix}$$

If each image is 28 x 28 pixels then X is a N x 784 matrix

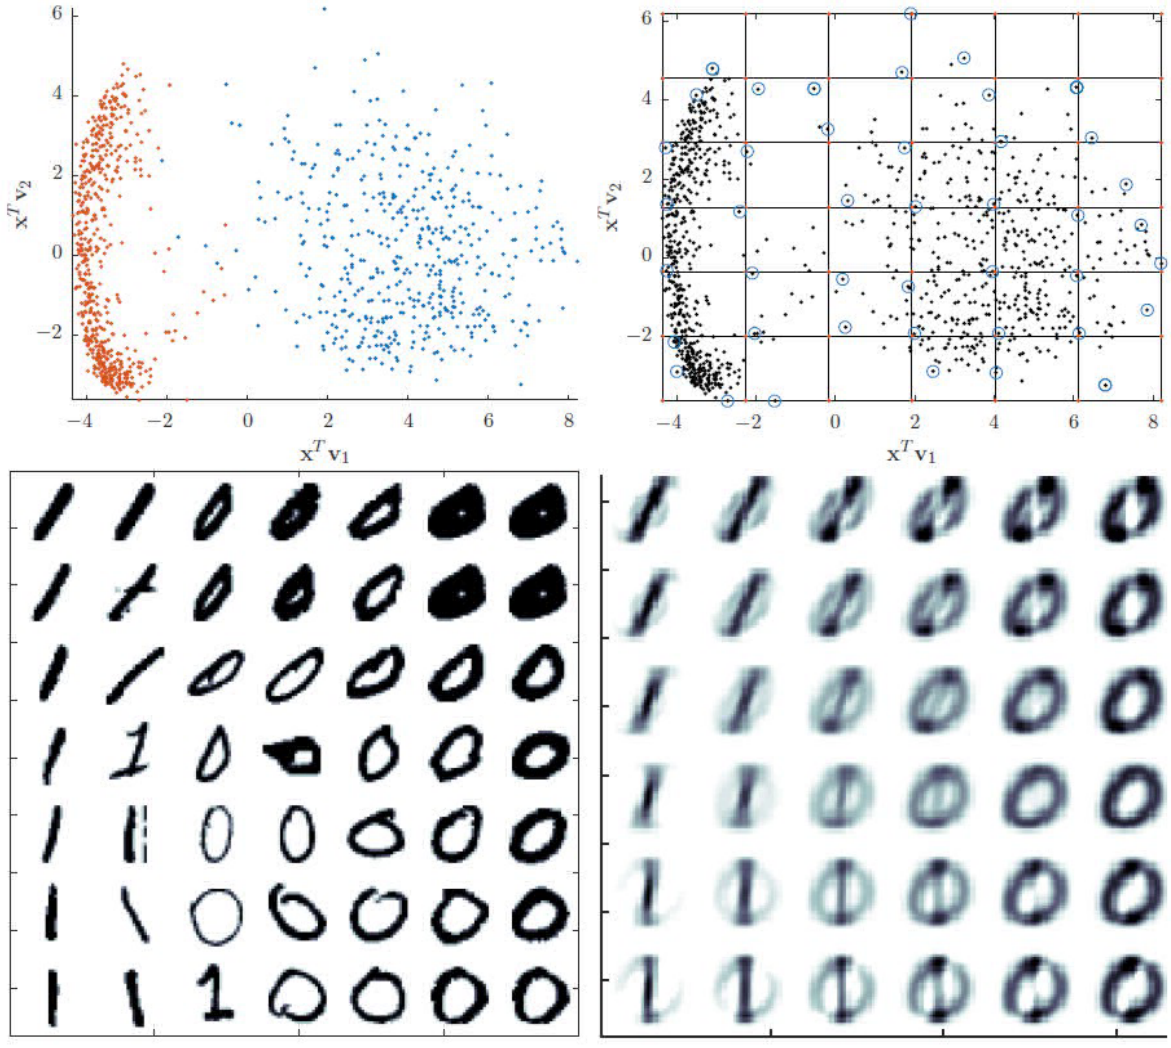
- Principal component analysis

$$\tilde{\boldsymbol{X}} = \boldsymbol{U}\boldsymbol{\Sigma}\boldsymbol{V}^\top$$



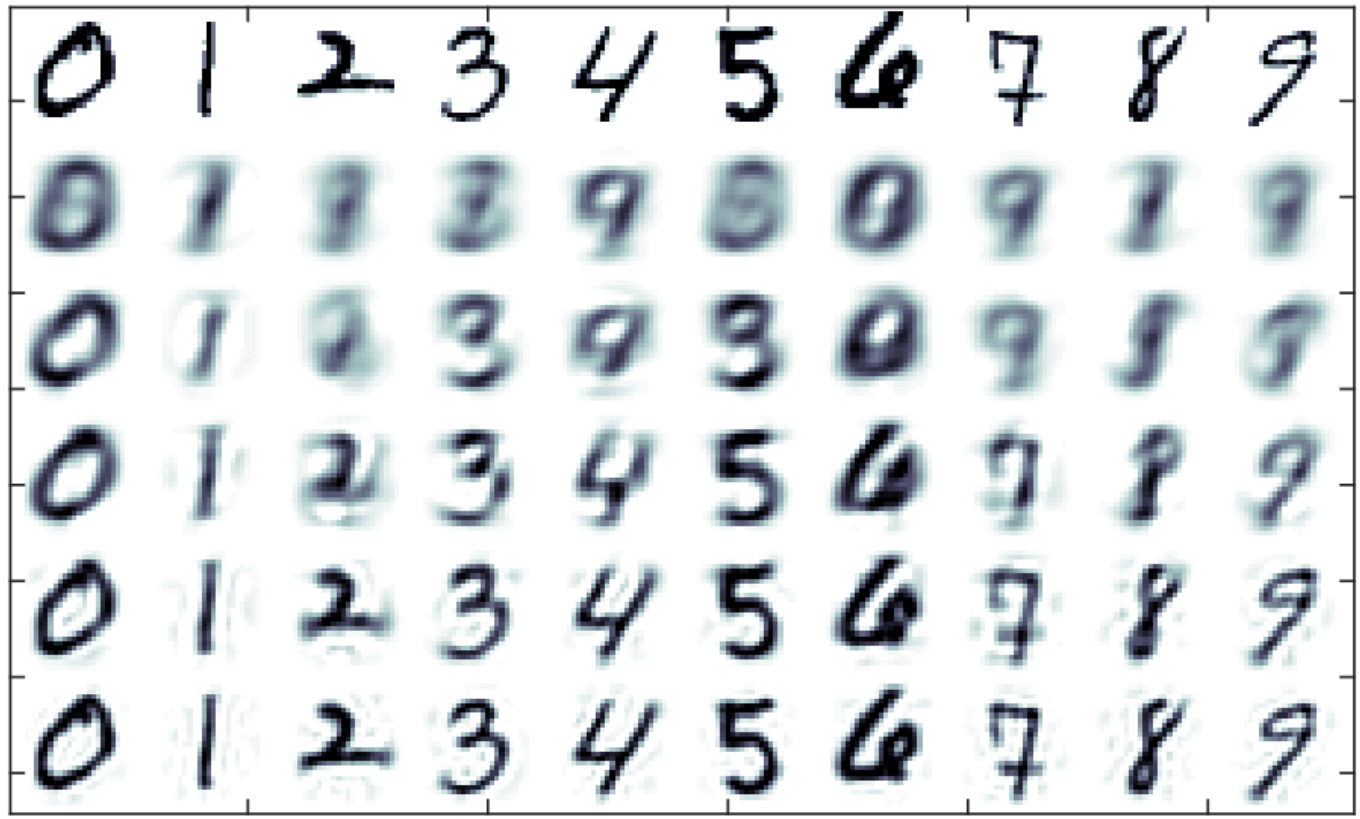
Visualization of hand written digits

...



PCA as compression

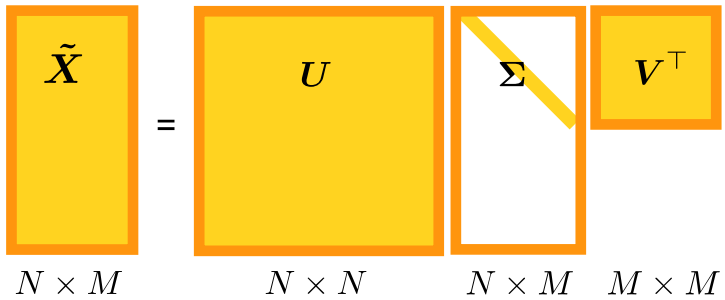
Only include a few components: $\hat{\boldsymbol{x}}_i = \boldsymbol{V}\boldsymbol{b} + \boldsymbol{m}$ n=2,5,20,50,100



Data and domain driven feature extraction

PCA is an example of a data driven approach for feature extraction

i.e., we define from data the features extracted in terms of the projections $V^{(PCA)}$ that preserve most of the variance in the data



The fourier transform is an example of a domain driven approach for feature extraction

i.e., *in the analysis of sound good features are often to use spectral representations. These can be found by projecting the data using the so-called fourier transform matrix $V^{(FFT)}$ where the components are defined as specific frequencies such that the projection of the data onto these frequencies defines the extend to which these frequencies are present in the data. (you can learn much more about this in 02451 Digital Signal Processing)*

$V^{(FFT)}=$
